(54) Title: **REMOTE POSITION CONTROL OF LIGHTING UNIT**

(57) **Abstract:** A lighting unit includes one or more lamps, a motor configured to adjust the position of the lamps, a controller configured to transmit drive signals to the motor in dependence on received signals and, for each of the lamps, a corresponding light detector connected to the controller such that receipt of modulated light at one of the light detectors gives an indication to the controller that the position of the corresponding lamp is to be adjusted. Used with the lighting unit is a remote-control unit, by means of which the user can, firstly, emit the modulated light, preferably laser light, to select the lamp to be moved and, secondly, emit a coded infrared or radio signal to then effect the desired movement of the lamp.
